

## ABSTRACT

The invention provides a composition and a method for preventing or  
5 ameliorating the causes of chronic allograft rejection of a donor organ by a transplant  
recipient. The method includes concomitant administration to the allograft recipient of  
therapeutically effective amounts of cyclosporin and 2-chlorodeoxyadenosine. The  
composition comprises a combination of these two immunosuppressive drugs in  
therapeutically effective amounts suitable for the practice of the method.
